The grayscale tests show a bright white at the highintensity end of the scale and a decent black at the lowintensity end, though we saw some compression on the dark end.

We saw some greenish tints in the midrange, but they were not pronounced. Screen uniformity tests show the 2005FPW to be slightly brighter in the corners than in the center, and some colors, most noticeably red, look slightly pale in the lower corners of the screen. The 2005FPW did not fare very well on our DVD and gaming tests. We saw lots of noise, as well as streaking and ghosting, but the details were generally good. Tollfree technical support is available from Dell for the life of the warranty. There is no printed user guide, but the manual on CDROM is sufficient. Monitor works fine but is used and shows the expected wear due to age. Its wide display is perfect for working with very wide or long documents and spreadsheets. Widescreen technology allows multiple applications to run on the screen simultaneously for a multimedia experience. Widescreen also improves productivity with less scrolling and toggling. It is an excellent option for videoediting and 3D imaging since both source and destination video can be viewed in a single window. The monitor includes videoinput ports, pictureinpicture, picturebypicture capabilities, and extra USB ports. A cable management system includes a pair of cupped, thick rubber panels to hold cords in place at the base of the neck. The features like picture in picture are good. There are some problems out there with scanlines showing up when you use hdmi.

I like this monitor because I can use a dual set up without purchasing extra gear because my computer has an hdmi and a vga out. I had a wonderful 19 inch monitor from Dell that still works

great, however, the time had come when I needed to recover some desk space and the old fellow is a monster. I bought a wide screen because I saw one in use at an office. It had two separate files open sidebyside and the user was moving things between them much more easily than I could by clicking back and forth between overlaying windows. I went with a 20 inch because Dell doesnt make a 19 inch widescreen. I wanted Dell because I am a long time happy user of Dell products. I have been pleasantly surprised by the extra features including the powered 2.0 USB ports, the excellent and highly adjustable stand, and PIP. The picture is bright and sharp. I had thoughts, before its delivery, that I would let my wife use it on he r computer and get another. It only took a few minutes of use to change that idea. I couldnt stand to part with it. I bought my wife a 19 inch Dell. These wide displays are perfect for juggling multiple windows or working with extremely wide or long documents and spreadsheets. Manufacturers of these extrawide LCDs hope to tempt graphics pros, video editors, gamers, and movie fans by including extra features such as videoinput ports, PIP pictureinpicture, PBP picturebypicture capabilities, and extra USB ports. The Dell 2005FPW has all of the above, and its image quality is more than good enough for most business uses. Plus, when you emerge from the mass of open windows and spreadsheets on your desktop, you can enjoy a movie in the PIP window. The first thing youll notice about the Dell 2005FPWs design is its extreme widthtoheight ratio. The d isplay area is 17 inches wide and just less than 11 inches tall, giving the display an image aspect ratio of 1610. This shape is sweet for DVD watching or looking at two lettersize images side by side.

By contrast, architects, designers, or anyone else who needs to view an enormously long vertical image such as that of legal documents need only rotate the panel to Portrait mode. The 2005FPWs looks are bland, though the sparkly, mattesilver plastic stand and trim provide a touch of panache. The bezel is matte black along the top and the sides, shiny black along the bottom, and it measures a svelte 0.75inch wide all the way around. For its size, the 2005FPW is quite adjustable. In Landscape mode, the neck telescopes 5 inches and in Portrait mode, it telescopes about 3.5 inches to bring the panel to a towering height of 23.5 inches. The 2005FPW is slightly wobbleprone, but you can make the unit more stable by locking the display into place at its lowest height. The Dell 2005FPW tilts 5 degrees forward and 20 degrees back, and it swivels 40 degrees to the left and the right. A pair of cupped, thick rubber panels hold cords in place at the base of the neck. The cable management system works well unless the cords become twisted around each other. If that happens, its easy to accidentally unplug the power cord when pivoting the panel. The 2005FPW has both digital and analog inputs, as well as SVideo and compositevideo ports. One downstream and four upstream ports make connecting peripherals a breeze. Speakers and a headphone jack dont come standard, but you can add both with Dells AS500 Sound Bar. Pictureinpicture and picturebypicture functionality allow you multitaskor play and work at the same time. One feature the Dell 2005FPW could use is bundled pivoting software. The user guide CDROM has detailed information about which graphics cards are best for rotating the operating system and what to do with other graphics cards, and it points users to the Dells Web site for updated drivers. However, it would be much nicer if the 2005FPW came with easytouse pivoting software like Portrait Displays PivotPro. The Dell 2005FPW comes with a threeyear warranty.

Tollfree technical support is available from Dell for the life of the warranty. There is no printed user guide, but the manual on CDROM is sufficient. Pivoting software not included; no printed user guide; speakers cost extra. The Dell 2005FPW has decent image quality and lots of extra features. Only serious graphics pros will be disappointed. The Dell 2005FPW belongs to an evergrowing family of enormous widescreen LCDs that includes the ViewSonic VP201b and the Planar PX212M. These wide displays are perfect for juggling multiple windows or working with extremely wide or long documents and spreadsheets. Manufacturers of these extrawide LCDs hope to tempt graphics

The sharpness of the images rendered to the screen are especially impressive. The added convenience of having 4 count-em USB ports along the monitor edge as well prove to me that the design and workmanship that went into this product has to be first-rate. Got a good deal on mine from eBay. Oh, forgot to mention gaming on this LCD is MOST impressive! Verisign. I was using my ATI Radeon video card driver software to reduce the brightness but GretaMcBeth EyeOne Display 2 resets this when attempting to calibrate. The screen is so bright even with the OSD control turned down all the way I can not get it low enough to fall within the range 140 of the EyeOne software. The lowest I can get it is 215. It seems there must be others with the same issue. Thanks.

I have a theory but unfortunately I don't have the EyeOne and can't download the manual to check it out. Need a product code or some such nonsense. It seems that many have trouble with high luminance on LCDs using the Eye One software. I don't use the EyeOne, I use Optix XR Pro but I tend to think it's just bad or confusing instructions that get people messed up. Do you have a backlight control as well as brightness and contrast on the Dell? If you can turn the backlight down independently I would try turning it down to 50% or slightly less. Does the Eye One offer an expert or advanced mode where you simply pick targets and manually measure and adjust to hit those targets. If it does that might work better for you. In fact many options of the front panel buttons are unavailable while running in DVI connector, such as contrast. Brightness is available but turning it down from 100 to 0 barely changes the output. The lowest I can get the panel by turning brightness all the way down is 215. Perhaps my ATI Radeon 7500 is just too old and the software can not write to the LUT. Edited by JohnJr on May 25, 2005 at 08:08 PM GMT Reason: typo I don't have a single dead pixel, nor do I have bad backlight bleeding issues. However, the brightness is unbearable in a dark room. The brightness control is controlling the backlight, however it doesn't give enough control.

Dont change brightness using your video card settings as this usually decreases contrast as well inherent problem with most lcds. Hmmm, I guess I should stay out of these PC discussions. Seems awful strange that the brightness control on the monitor will not control the brightness of the monitor. Its bright as hell and no brightness control enabled; it makes my laptop look like a teeny tiny light; i wish i could crank down the FP. Its bright as hell and no brightness control enabled; Well I guess this answers the debate about why one would pay the extra 150 bucks or whatever it is for the Apple over the dell.

at least for those with Macs. I guess Ill just have to keep my sun glasses next to the screen. I must say Im very impressed with the Dell. And I love the PIP function for watching TV Kim The next task was to check the color temp against the one Id chosen; I adjusted the channels the display will show you where all three need to be to attain the correct color temp if you select the setting for manual adjustment when you start until the temp was correct. Unfortunately, when I backed up a bit, I saw that the adjustments had pushed the luminance off a bit, so I took a point from each channel and went through the process again. it took a few iterations, but it did seem to work. BTW, I think I had to pull them down to the 22% range ! to get mine down to 100 or so. 140 was WAY too high to match prints as well as my crt. They match quite well now. It wasnt as simple as I was hoping, but it was the only way I could see to adjust the luminance while using the DVI input. Oh remember to move the OSD down to a corner so that it isnt behind the sensor, and you can adjust things while the sensor is on the screen. Eric Im going blind looking at this thing. I have not been able to properly calibrate. Your idea seemed to have worked. At least this time when I went through the process I was able to get the adjustments within the paramaters. I set my OSD to 74,71,69 Red,Green,Blue and have the OSD brightness set to 69. Im going to run some test prints and send some more off to WHCC to see how much closer they are. Thanks for the tips. John Great monitor but way too bright. Jack Login or Register.
